

Division of Health Science, Graduate School of Medicine

Based on Osaka University Admission Policies, the master's course at the Division of Health Science seeks individuals who want to become clinical practitioners, clinical engineers, researchers, and instructors who study with a spirit of inquiry and make efforts to solve problems in health, medical care, and welfare in Japan and the world in the future. We believe that students from different backgrounds studying together will give a birth to breakthrough ideas and cultivate a high degree of professionalism and rich humanity. People who can act as leaders in team medical care and local medical care as medical professionals and those who are involved in R&D as researchers need to have a broad perspective and flexible understanding, as well as basic English proficiency. In Japan, which faces rapid aging, the Division of Health Science seeks individuals who are enthusiastic about contributing to advance in health and those who are eager to research in the development of new technologies.

The doctor's course at the Division of Health Science aims to cultivate researchers who can serve as international leaders in health sciences with broad knowledge. To this end, in addition to a high level of linguistic ability, a high level of design prowess – capable of exploring a new field from the embryonic stage and carrying out new development by integrating their specialized fields with other fields – is needed. Furthermore, it's also important to have a high sense of ethics in conducting research in the fields of health, medical care, and welfare. This course welcomes individuals who have multilateral perspectives and aim to make international contributions in the fields of health, medical care, and welfare in the future so that they will be sought after not only by medical circles, but also by industry.
